Professor

**Electrical and Computer Engineering and Biomedical Engineering Departments,
Whiting School of Engineering, Johns Hopkins University** – July '21 – present

I am focused on the modular design and use of biological implants for the study and treatment of neural pathologies. Module types include those for: single and population neural recording; cortical and peripheral nerve excitation, inhibition, and blocking; muscle, including cardiac, digestive, and peripheral activity recording and control; and biochemical marker sensing. Engineering challenges in: open and closed-loop sensing and/or stimulation; wireless power, storage, and data transfer; and machine learning for autonomous personalized therapy arise from the physiological needs and are addressed as needed in my research. When combined into distinct embedded systems, these modules enable us, in partnership with scientists and clinicians working with our lab, to conduct high impact and hereto impracticable experiments. Specific research and clinical applications explored include: epilepsy, glaucoma, gastric motility, and photopharmacology.
